BRYNEX ONE AI

HR Brain Development Brief

Functional architecture, data model, workflows, management decision logic and MVP scope for the first departmental AI brain.

Purpose
Provide the IT and product team with a build-ready functional blueprint for an HR Intelligence System that captures the employee lifecycle, converts activity into measurable data, detects issues, supports management decisions and learns from outcomes.

Core operating principle

Employee Data → Activity → Performance → Diagnosis → Management Decision → Action → Outcome → Learning

Version 0.1 | Product Architecture Draft

Prepared for internal product and engineering discussion

1. Product Objective

The HR Brain should not be designed as a generic HR chatbot. It should function as an intelligence and decision-support layer over workforce data, business performance and management workflows.

The product should answer three classes of questions:

- What is happening in the workforce?
- Why is it happening?
- What management action is most likely to improve the result?

The system must combine company-specific data with structured management logic, while keeping humans responsible for consequential employment decisions.

2. Functional Scope

Module	Primary Purpose	Core Output
Workforce Planning	Determine required manpower and capacity	Required vs actual manpower
Recruitment	Source and select suitable employees	Hiring funnel, source quality, quality of hire
Onboarding & Probation	Make new hires productive faster	Time-to-productivity, probation outcome
Attendance & Scheduling	Measure workforce availability and deployment	Attendance, roster efficiency, productive hours
Role & Responsibility	Define accountability by position	Role cards, KPI ownership, process ownership
Performance Management	Measure contribution continuously	Role-specific performance score
Learning & Development	Close skill gaps	Skill matrix, training impact
Compensation & Payroll	Understand people cost	Payroll efficiency, incentive ROI
Engagement & Retention	Identify workforce risks	Attrition and engagement signals
Compliance & Exit	Control lifecycle documentation	Compliance status, exit intelligence

3. Core Data Object: Employee Digital Profile

Every employee must have a continuously evolving digital profile. This becomes the core right-brain HR entity and the common key that links HR, finance, sales and operations data.

Data Group	Examples
Identity & Employment	Employee ID, joining date, status, employment type, location, department
Organisation	Role, reporting manager, branch, team, hierarchy level
Cost	Salary, incentives, overtime, employer cost, allocated cost
Capability	Skills, certifications, experience, assessments, skill gaps
Accountability	Role purpose, responsibilities, owned processes, KPIs, targets
Work Pattern	Attendance, leave, roster, shift, working hours, overtime
Activity & Output	Tasks, sales, cases handled, transactions, output quantity, quality
Performance	KPI actuals, review history, manager assessment, performance trend
Development	Training assigned, completion, assessment, post-training impact
Employee Relations	Recognition, feedback, documented incidents, grievances, actions
Lifecycle	Probation, promotion, transfer, salary revision, exit reason, rehire status

Data-design rule

The profile should store both master data and time-series events. Do not overwrite important historical states such as role, salary, manager, branch or KPI target; preserve effective dates so AI can reason over change.

4. Organisation & Role Architecture

AI cannot evaluate people correctly unless roles and accountability are structured. Every position should therefore have a Role Card.

Role Card Field	Example
Role purpose	Deliver store revenue, customer experience and operating discipline
Responsibilities	Sales management, team supervision, inventory control, reporting
Processes owned	Opening/closing, cash control, stock review, roster approval
KPIs	Revenue, conversion, payroll ratio, stock variance, customer complaints
Authority	Approvals, escalation limits, employee actions
Dependencies	Marketing leads, inventory availability, finance controls

Logical chain: Role → Responsibility → Process → Activity → KPI → Target → Actual → Performance

5. Workforce Planning Workflow

Business Target → Workload → Required Roles → Required Man-hours → Current Capacity → Gap Analysis → Management Action

Input data

- Revenue and transaction targets
- Operating hours and shifts
- Footfall / workload / case volume
- Current headcount and productive hours
- Overtime and absenteeism
- Seasonality and branch demand
- Payroll cost and productivity benchmarks

Decision outputs

- Hire
- Transfer
- Reschedule
- Reduce overlap
- Cross-train
- Automate process
- Improve individual or manager productivity

AI should challenge the manpower request. A manager asking for one more employee should trigger capacity analysis before recruitment approval.

6. Recruitment Intelligence Workflow

Stage	Data Captured	AI / Management Use
Manpower request	Role, reason, workload gap, location	Validate need
Sourcing	Channel, campaign, referral source, cost	Source effectiveness
Screening	Eligibility, skills, experience, assessment	Shortlisting support
Interview	Structured scores, comments, panel	Consistency and evidence
Offer	CTC, proposed role, date	Offer acceptance analytics
Joining	Joined / no-show / delay	Conversion tracking
30/90-day review	Attendance, KPI progress, manager review	Quality of hire
6/12-month outcome	Performance and retention	Source and selection learning

Critical link

Candidate → Source → Screening → Interview → Hiring Decision → Onboarding → 90-day result → 1-year performance → Retention. This allows Brynex to learn which recruiting sources and selection signals actually correlate with success for that business.

7. Onboarding & Probation

Each role should have a standard onboarding journey with milestones, assessments and productivity expectations.

Milestone	Illustrative Requirement
Day 1	Company orientation, policy acknowledgement, role briefing
Week 1	Systems, product/process, supervisor shadowing
Day 30	Knowledge check, attendance review, early KPI review
Day 60	Skill-gap review, manager feedback, corrective training
Day 90	Probation decision based on defined evidence

Primary metric: Time to Productivity = number of days from joining until the employee consistently reaches the minimum expected output for the role.

8. Attendance, Roster & Workforce Utilisation

Attendance must not be treated as payroll-only data. The useful relationship is attendance + scheduled capacity + actual productive output.

Metric	Purpose
Attendance %	Availability
Productive hours	Actual usable working time
Revenue per employee	Headcount productivity
Revenue per labour hour	Time productivity
Transactions / cases per employee	Workload productivity
Overtime dependency	Structural staffing problem indicator
Absenteeism rate	Reliability and capacity risk
Schedule efficiency	Match between demand and staffing

Context rule

AI should compare an employee against role, branch, shift, customer traffic and operational conditions. Attendance or sales alone must not determine performance.

9. Performance Management Engine

Performance formulas must be role-specific. A configurable score engine should support weighted categories and effective dates.

Component	Illustrative Weight	Examples
Business KPIs	40%	Sales, output, conversion, productivity
Process Compliance	20%	SOP adherence, reporting, task completion
Customer / Quality	15%	Complaints, errors, quality scores
Manager Assessment	15%	Reliability, initiative, leadership
Learning	10%	Training, assessment, demonstrated skill progress

10. AI Performance Diagnosis

The system should never equate a low result directly with a poor employee. It should diagnose context and possible root causes before recommending action.

Signal	Diagnostic Questions
Performance decline	Attendance issue? Low traffic? Bad shift? Stock issue? Training gap? Manager problem? Target unrealistic?
High payroll ratio	Revenue decline? Excess staffing? Overtime? Shift overlap? Low productivity?
High attrition	Specific manager? Role? tenure band? location? pay structure? onboarding weakness?
Low conversion	Individual issue? lead quality? product availability? traffic mix? training? pricing?

Expected output

For each significant issue: evidence summary, likely causes, confidence level, missing data, 2-3 management options, expected impact, risks and recommended next action.

11. Learning & Skill Intelligence

Every role should have a competency matrix. Training is successful only if capability and workplace results improve after the intervention.

Skill	Required Level	Current Level	Gap	Action
Product knowledge	5	4	1	Advanced module
Customer communication	5	3	2	Coaching + observed practice
Closing ability	5	2	3	Sales clinic + manager review
POS usage	4	4	0	No action

Closed loop: Skill Gap → Training → Assessment → Workplace KPI → Result

12. Compensation & Workforce Economics

- Payroll / Revenue
- Payroll / Gross Profit
- Employee Cost / Revenue
- Revenue per ₹1 of salary
- Overtime cost
- Incentive ROI
- Cost per productive hour
- Headcount cost by branch / department / role

The goal is not to minimise salary. The goal is to optimise workforce cost relative to sustainable output, quality and customer experience.

13. Engagement, Retention & Employee Relations

The system can use operational signals to surface workforce risk, but consequential actions must remain human-reviewed.

- Attendance deterioration
- Repeated leave or shift conflicts
- Manager changes
- Performance decline
- Training disengagement
- Tenure-based attrition patterns
- Documented employee feedback
- Recognition frequency
- Role / location mismatch

Safeguard

Do not use sensitive or protected characteristics to score employee quality, retention risk or suitability. AI-generated risk indicators should trigger review, not automatic promotion, discipline, termination or compensation decisions.

14. Compliance & Lifecycle Control

Lifecycle Area	Controls / Data
Joining	Offer, contract, ID, statutory details, acknowledgements
Active employment	Policy acceptance, leave, attendance, payroll, role history
Changes	Transfer, promotion, manager, salary, branch, responsibilities
Employee relations	Grievance, inquiry, warning, resolution, approvals
Exit	Resignation/termination workflow, notice, handover, settlement, exit interview
Post-exit	Reason taxonomy, rehire status, alumni / reference controls

15. Management Intelligence Layer

The management dashboard should prioritise decisions and exceptions, not merely display employee counts.

Priority	Illustrative Insight
Critical	Store payroll increased 14% while revenue declined 8%
Attention	Seven sales employees remain below role benchmark for 3 months
Opportunity	Store Y generates 22% higher revenue per employee with similar staffing
Hiring	Operations capacity suggests two additional roles; Store Z appears overstaffed by two

16. Standard Management Decision Workflow

Data → Signal → Variance → Diagnosis → Root Cause → Options → Expected Impact → Risk → Human Decision → Action Plan → Owner → Deadline → Result → Learning

Step	Example
Signal	Payroll ratio reached 18% vs 12% target
Diagnosis	Revenue down, shift overlap high, overtime concentrated in two teams
Option A	Improve productivity without headcount reduction
Option B	Transfer excess capacity to understaffed branches
Option C	Roster optimisation and reduced overlap
Decision	Management selects B + C
30-day outcome	Payroll ratio improves to 14.5%; revenue maintained
Learning	Store staffing benchmark and roster rule updated

17. High-Value Data Relationships

Prioritise data relationships over collecting hundreds of disconnected fields.

Employee → Role → Branch → Manager → Salary Cost → Attendance / Hours → Activities → Target → Actual Output → Performance → Training → Management Action → Outcome

This creates the key business relationship: Cost → Activity → Output → Outcome.

18. HR Left-Brain Knowledge Modules

Knowledge Domain	Structured Content Needed
Organisation Design	Spans, layers, accountability, role clarity, RACI-like rules
Workforce Planning	Capacity planning, staffing economics, workload models
Recruitment	Structured selection, interview design, quality-of-hire
Performance	Objectives, KPIs, coaching, improvement plans
Leadership	Manager effectiveness, delegation, team development
Learning	Competency models, skill-gap closure
Compensation	Salary structure, incentives, productivity economics
Employee Relations	Grievance, discipline, documentation workflows
Culture & Engagement	Feedback loops, recognition, retention
Compliance	Employment documentation, approvals, audit trail

Store the left-brain knowledge as frameworks, rules, diagnostic questions, metrics and playbooks - not as an unstructured collection of books.

19. Suggested Core Data Entities for Development

Entity	Key Relationships
Employee	Role, branch, manager, employment status
Role	Department, responsibilities, competencies, KPIs
Organisation Unit	Company, brand, branch, department, team
Employment Event	Join, transfer, promotion, salary revision, exit
Attendance Event	Employee, date, shift, in/out, status
Roster / Shift	Location, demand period, assigned employees
KPI Definition	Role, formula, target type, weight
KPI Actual	Employee/unit, period, value, source
Performance Review	Employee, reviewer, score, comments, actions
Skill / Competency	Role requirement, employee level
Training Event	Course, employee, assessment, follow-up KPI
Recruitment Candidate	Vacancy, source, stages, scores, outcome
Decision Record	Issue, evidence, options, approver, selected action
Action / Task	Decision, owner, deadline, KPI, status
Outcome Record	Action, result, measured impact, learning

20. Access, Governance & Audit Requirements

- Role-based access by company, brand, branch and department
- Separate employee self-service, manager, HR, finance and executive permissions
- Field-level protection for compensation, disciplinary and personal data
- Complete audit log for data changes, recommendations, approvals and AI actions
- Source traceability for every AI conclusion where possible
- Human approval for high-impact employment actions
- Configurable data-retention and deletion policies
- Tenant isolation between customer companies

21. Recommended MVP - HR Brain V1

Priority	Capability
P0	Employee master + organisation hierarchy
P0	Role cards + responsibilities + KPI definitions
P0	Attendance / roster import or integration
P0	KPI actuals + performance score engine
P0	Workforce economics dashboard
P0	AI insights: detect → diagnose → recommend
P0	Management decision record + action tracking
P1	Recruitment funnel + quality-of-hire
P1	Onboarding / probation workflows
P1	Skill matrix + learning
P2	Engagement / retention intelligence
P2	Advanced compensation and incentive optimisation

22. HR Brain V1 - Logical Flow

EMPLOYEE MASTER DATA
↓
ORGANISATION + ROLE + KPI ENGINE
↓
ATTENDANCE / ROSTER + BUSINESS OUTPUT
↓
PERFORMANCE ENGINE
↓
WORKFORCE ECONOMICS
↓
AI DETECTION + DIAGNOSIS + RECOMMENDATION
↓
MANAGEMENT DECISION
↓
ACTION + OWNER + DEADLINE
↓
RESULT + LEARNING

23. Development Principles

- Design for structured data first; use documents and chat as supporting interfaces.
- Keep historical states with effective dates so trends and cause/effect can be analysed.
- Every AI insight should identify the data used, missing data and confidence.
- Separate raw facts, derived metrics, AI hypotheses and approved management decisions.
- Make KPI formulas configurable by role and business.
- Integrate with Finance, Sales and Operations data early because HR productivity depends on business context.
- Do not automate high-impact employment decisions without explicit human approval.
- Capture the result of decisions so the system can learn what works for each business.

24. Success Definition

The HR Brain succeeds when management can answer, with evidence:

- Do we have the right number of people?
- Are they in the right roles and shifts?
- What is each role expected to deliver?
- Who or what is causing performance variance?
- Is the problem people, process, manager, demand, inventory or target design?
- Which management action is most likely to improve the outcome?
- What happened after we acted?

Long-term objective

Right people + right role + right capacity + right cost + right management action = stronger business outcomes.
